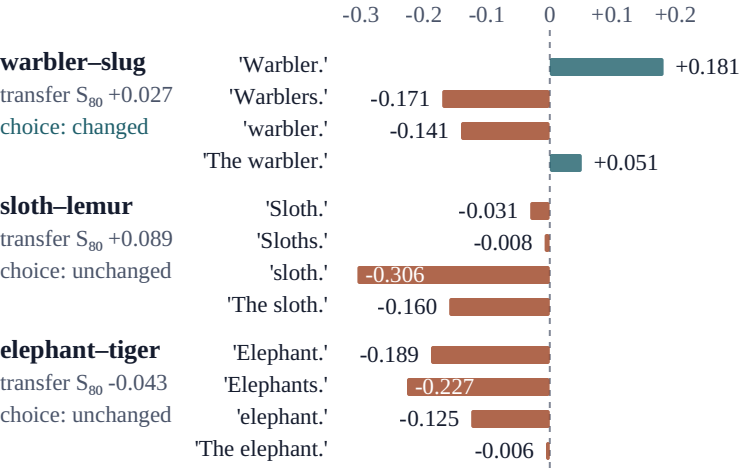
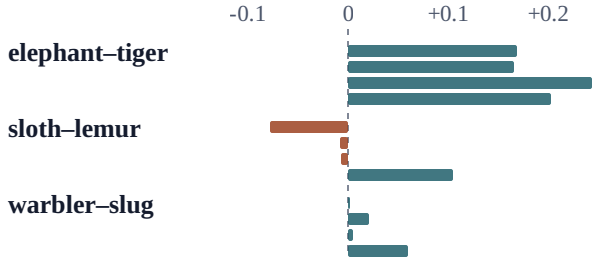
a Margin per answer form in three cells



b Gradient overlap at the start policy



cosine between the gradients of B and of each form;
bars: Capital · Capital plural · lowercase · The …

Llama · SP · number, eight seed pairs per cell; margin per form: log p(T form) − log p(E form)

c Cells showing an effect at each answer layer (layers measured separately, not nested)

transfer on the preference evaluation (24; 18 established)	carried by the first name token	spreads to the direct-answer name form	changes the sampled answer
24 cells	12 cells	3 cells	2 cells

Counts are cells, not seeds; each layer is evaluated on its own set of cells.
